

**WHAT IS CLAIMED IS:**

1. A breakable container comprising:

a) a first half;

b) a second half;

5 c) a fastener to attach the first half and the second  
half together; and

b) a decorative portion;

wherein the first half and the second half form a hollow  
main body when the first half and the second half are

10 assembled by engaging the fastener, wherein the  
decorative portion is attached to the main body, and  
wherein the first half and the second half are made of  
fragile material.

15 2. The breakable container of claim 1 wherein the first half  
comprises one or more first half projections, and the  
second half comprises one or more second half  
projections, wherein the first half projections and the  
second half projections form one or more main projections  
20 that extend from the main body when the first half and  
the second half are assembled by engaging the fastener,  
wherein the decorative portion comprises one or more  
decoration enclosures, each of the decoration enclosures

comprises a connecting end that is attached to the main projection.

3. The breakable container of claim 2 wherein the decoration  
5 enclosures are cone-shaped.

4. The breakable container of claim 1 wherein the fastener  
comprises a plurality of fixing projections provided on  
the first half along the mating line between the first  
10 half and the second half, and a plurality of fixing  
recesses provided on the second half along the mating  
line between the first half and the second half, wherein  
the fixing projections are inserted into the fixing  
recesses and fit tight with each other when the first  
15 half and the second half are assembled.

5. The breakable container of claim 4 wherein the first half  
comprises one or more first half projections, and the  
second half comprises one or more second half  
20 projections, wherein the first half projections and the  
second half projections form one or more main projections  
that extend from the main body when the first half and  
the second half are assembled by engaging the fastener,  
wherein the decorative portion comprises one or more

decoration enclosures, each of the decoration enclosure comprises a connecting end that is attached to the main projection.

5 6. The breakable container of claim 5 wherein the fixing projections are provided on the first half projections, and the fixing recesses provided on the second half projections.

10 7. The breakable container of claim 6 wherein the fastener further comprises a flexible hinge positioned between the first half and the second half, and integrated with the first half and the second half.

15 8. The breakable container of claim 7 wherein the flexible hinge is provided between one of the first half projections and the second projection that mates with the first half projection on which the flexible hinge is provided.

20

9. The breakable container of claim 5 wherein the decoration enclosures are cone-shaped.

10. The breakable container of claim 9 wherein the decoration enclosures are attached to the main projections with adhesive tapes that are pre-installed on the main projections.

5

11. The breakable container of claim 5 wherein at least one of the main projections extend radially from the main body in a plane along which the first half and the second half are mated.

10

12. The breakable container of claim 11 wherein at least one of the main projections extend from the main body in a direction perpendicular to the plane along which the first half and the second half are mated.

15

13. The breakable container of claim 5 wherein the decorative portion further comprises one or more decorative sheets that are attached to the main body.

20 14. The breakable container of claim 5 further comprising a string attached to the main body, whereby the breakable container can be suspended in the air.

15. The breakable container of claim 4 wherein the first half and the second half are made of paper, styrofoam or plastic foam.

5
